Md Zohair Sait

+91 8807299820 | saitzohair@gmail.com | linkedin.com | github.com/ZohairSait | Portfolio

Summary

Passionate about cybersecurity and digital forensics, with hands-on experience in vulnerability assessment and penetration testing using Kali Linux, Nmap, Burp Suite, and Metasploit. Strong in Python and analytical problem-solving, with a focus on risk analysis and secure coding through practical, real-world projects.

Education

M.Tech in Cyber Security and Digital Forensics CGPA: 9.29
Vellore Institute of Technology *2025- 2027 (Expected)*

B.Tech in Information Technology CGPA: 8.47
Meenakshi College of Engineering *2021-2025*

Technical Skills

- **Programming & Query Language**: Python, SQL
- **Security Concepts**: OWASP Top 10, Vulnerability Assessment, Penetration Testing, Basic Privilege Escalation, Web Security Fundamentals, Threat Detection
- **Tools & Platforms**: Kali Linux, Nmap, Metasploit, Burp Suite, Wireshark, Nessus, TryHackMe
- **Networking & Operating Systems**: TCP/IP, HTTP, DNS, Linux Fundamentals, Windows Fundamentals

Internship

QSpiders Apr 2025 – Jun 2025
Technical Training / Internship

- Gained hands-on experience in Python programming, including programming fundamentals, problem-solving, and scripting
- Learned SQL concepts including database queries, joins, filtering, aggregation, and data manipulation
- Practiced Python and SQL through hands-on exercises and technical assignments

Projects

AI-Based Network Intrusion Detection System with Real-Time Dashboard *[GitHub]* May 2026
Cybersecurity + AI/ML Project *Python, Scapy, TensorFlow, Flask*

- Built a real-time IDS to capture and analyze live network traffic using Scapy, grouping packets into flows
- Trained an Autoencoder-based anomaly detection model on ~250K+ network flow samples, including custom browser traffic
- Detected attacks such as ICMP Floods, Traffic Floods, and Port Scans using anomaly-based traffic analysis
- Developed a Flask-based dashboard for real-time monitoring with auto-refresh and color-coded alerts

Hybrid Phishing URL Detection System using Machine Learning *[GitHub]* Jan 2026
Cybersecurity & Machine Learning Project *Python, Flask, scikit-learn*

- Analyzed URL datasets using rule-based and machine learning techniques for phishing detection
- Identified typosquatting and brand impersonation patterns using Levenshtein distance analysis
- Trained Logistic Regression, Decision Tree, and Random Forest models for classification
- Reduced false positives using a hybrid detection approach and categorized URLs into risk levels

Advanced Password Security Analyzer with Real-World Attack Simulation *[GitHub]* Aug 2025
Cybersecurity Project *Python, Flask*

- Evaluated password strength using entropy and character-space analysis across multiple combinations
- Implemented brute-force and dictionary-based password attack simulations
- Estimated password crack times across varying password complexity levels
- Compared CPU and GPU-based password cracking performance and analyzed weak passwords using breach-style datasets

Certifications

- Certified Ethical Hacker (CEH) – Pursuing
- Hands-on cybersecurity practice through TryHackMe labs
