Summary

Passionate about cybersecurity and digital forensics, with hands-on experience in vulnerability assessment and penetration testing using Kali Linux, Nmap, Burp Suite, and Metasploit. Strong in Python and analytical problem-solving, with a focus on risk analysis and secure coding through practical, real-world projects.

Education

M.Tech in Cyber Security and Digital Forensics CGPA: 9.36
Vellore Institute of Technology *2025- 2027 (Expected)*

B.Tech in Information Technology CGPA: 8.47
Meenakshi College of Engineering *2021-2025*

Technical Skills

- **Programming**: Python, Java, SQL, JavaScript, HTML, CSS, Bootstrap
- **Tools & Platforms**: Git, Kali Linux, Wireshark, Nmap, Metasploit, Burp Suite, Nessus
- **Security Concepts**: OWASP Top 10, Vulnerability Assessment, Penetration Testing
- **Data Science & Analytics**: NumPy, Pandas, Matplotlib
- **Soft Skills**: Problem Solving, Communication, Critical Thinking, Leadership

Projects

AI-Based Network Intrusion Detection System with Real-Time Dashboard *[GitHub]* May 2026
Cybersecurity + AI/ML Project *Python, Scapy, TensorFlow, Flask*

- Built a real-time IDS to capture and analyze live network traffic using Scapy, grouping packets into flows
- Trained an Autoencoder-based anomaly detection model on ~250K+ network flow samples, including custom browser traffic
- Detected ICMP Flood, Traffic Flood, and Port Scan attacks with improved precision by tuning reconstruction error thresholds
- Developed a Flask-based dashboard for real-time monitoring with auto-refresh and color-coded alerts

Hybrid Phishing URL Detection System using Machine Learning *[GitHub]* Jan 2026
Cybersecurity & Machine Learning Project *Python, Flask, scikit-learn*

- Built a hybrid phishing detection system combining rule-based and machine learning techniques
- Used Levenshtein distance to detect typosquatting and brand impersonation attacks
- Trained and evaluated Logistic Regression, Decision Tree, and Random Forest models
- Implemented explainable risk-based classification (Legitimate, Suspicious, Phishing)

Advanced Password Security Analyzer with Real-World Attack Simulation *[GitHub]* Aug 2025
Cybersecurity Project *Python, Flask*

- Analyzed password strength using entropy and character-space calculations
- Simulated real-world attacks including brute-force and dictionary-based cracking
- Compared CPU vs GPU cracking speeds and estimated password crack time
- Detected commonly used and leaked passwords using breach-style datasets

Market Basket Insights *[GitHub]* Aug 2022
Data Analytics Project *Python, Pandas, Matplotlib, Apriori*

- Performed Market Basket Analysis to identify frequent itemsets and association rules
- Preprocessed transactional data using Pandas and applied the Apriori algorithm
- Visualized customer purchasing patterns using Matplotlib

Certifications

- Certified Ethical Hacker (CEH) – Pursuing
